

EasySave 3.0 - User Guide

Getting started

- Launch EasySaveWpf.exe. Add jobs (name, source folder, target folder, Full or Differential).
- Run one job from its card, or use Run All to run every job in parallel.
- Config is stored under %AppData%\EasySave\ (jobs, settings, live state, local logs).

Per-job controls

- Play: start or resume. Pause: stops after the current file finishes. Stop: cancels immediately.
- Progress bar and current file name update in real time during backup.

Settings

- Language, log format (JSON/XML), state format, encryption extensions and key.
- Business software: process names (one per line); backups pause while they run, then resume.
- Log mode: Local (PC only), Centralized (company server only), or Both.
- Central log server: host:port (e.g. 127.0.0.1:5132) when using central logging.
- Priority extensions: copied first across all jobs (one per line, e.g. .key).
- Large file threshold (KB): at most one file larger than this size at a time across jobs (0 = off).

Logs and CLI

- Local daily logs: %AppData%\EasySave\Logs\yyyy-MM-dd.json or .xml (if Local or Both).
- Command line: EasySaveWpf.exe 1-3 or 1;3 to run jobs without opening the GUI.
- Avoid system folders (e.g. C:\Windows); use your own data folders to prevent access errors.
